KHRONOS
GROUP

A coordinated ecosystem of
compute, graphics and media
standards and APIs

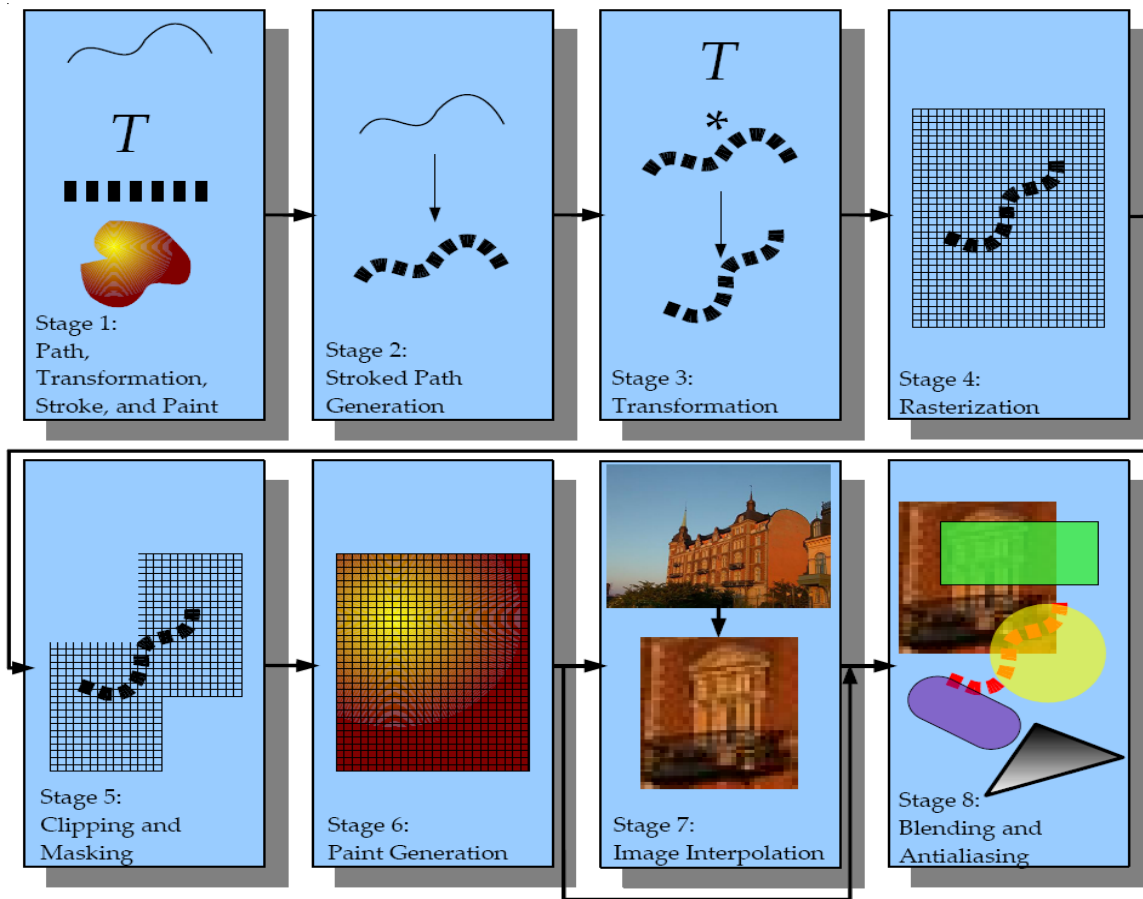

Hundreds of man years invested by industry experts to create a coordinated visual computing ecosystem for accelerated parallel computation, 3D, video, audio and image processing on desktop, embedded and mobile systems

OpenVG

- **Royalty-free open standard API**
- **Low-level 2D vector graphics rendering API**
- **OpenGL-style programming model**
- **Advanced feature set enables**
 - SVG,
 - Flash,
 - PDF, Postscript,
 - Java (JSR 287, 271, 226)
 - etc.
- **Portable content**
- **Map Applications**
- **Hardware Acceleration**

OpenVG Rendering Pipeline

Path Definition

- **MOVE_TO, LINE_TO, QUAD_TO, CUBIC_TO, CLOSE_PATH**

- **Elliptical Arcs**

- **Absolute / Relative Coordinates**

- **Smooth Curves**

- **Path Interpolation**

- **Path Queries:**

- Bounding Boxes
- Transformed Bounding Boxes
- Point along path
- Tangent along path

- **Non-Zero and Even-Odd fill rules**

Stroking

- **Stroking takes a path and defines an outline around it:**
 - Line Width
 - End cap style (Butt, Round, or Square)
 - Line join style (Bevel, Round, or Miter)
 - Miter limit (to convert long miters to bevels)
 - Dash array and offset

Dash array = { 10, 20, 30, 40 } / Dash Phase = 35

Transformations

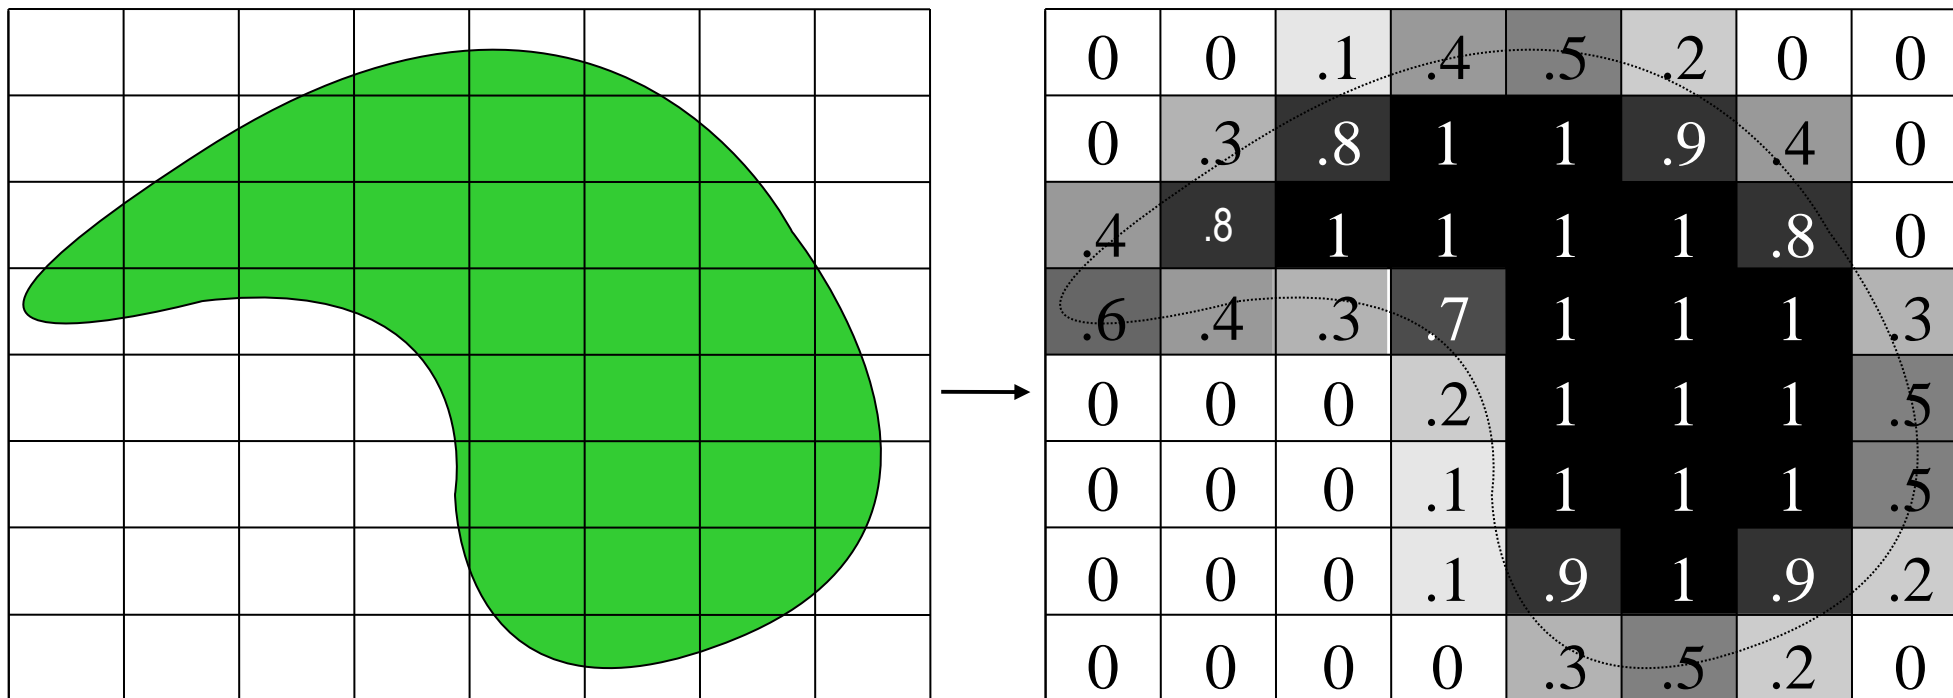

- Paths use 2x3 affine transformations
- Images use 3x3 perspective transformations
- Transformation functions are similar to OpenGL:
 - vgLoadIdentity
 - vgLoadMatrix
 - vgGetMatrix
 - vgMultMatrix
 - vgScale
 - vgRotate
 - vgTranslate
 - vgShear

$$\begin{bmatrix} 1.080 & 0.101 & 0 \\ 0.209 & 0.691 & 0 \\ 1.28 \times 10^{-3} & -1.19 \times 10^{-3} & 1 \end{bmatrix}$$

Rasterization (continued)

- The goal of rasterization is to determine a filtered alpha value for each pixel, based on the geometry around that pixel
- Filters may be up to 3 pixels in diameter

Scissoring

- Only pixels inside a set of scissor rectangles are drawn
- Scissoring is disabled by default

Masking

- In addition to scissoring, a per-pixel mask may be applied
- The mask has an alpha value at each pixel that is multiplied by the alpha from the rendering stage
- May be used to “cut out” an area, create area transitions
- Mask values may be modified using image data
 - Fill, Clear, Set, Add, Subtract, Intersect

Paint Generation

- **Paint is generated pixel-by-pixel and applied to geometry**
- **The alpha from the previous stage (rendering + masking) is used to determine how much paint to apply**
- **Separate paint objects for stroking, filling**
- **Paint is transformed by an affine transform**
- **Four types of paint are supported:**
 - Flat color paint
 - Linear gradient paint: points (x_1, y_1) and (x_2, y_2) , color ramp
 - Radial gradient paint: center (x, y) , focus (x, y) , radius, color ramp
 - Pattern paint based on an image, tiling mode

Blending

- **Combine masked alpha from path with paint alpha**
- **Blend the result onto the drawing surface**
- **Blending is a function of:**
 - The paint (R, G, B) color
 - The masked alpha value (path alpha \cdot mask alpha \cdot paint alpha)
 - The destination (R, G, B) color
 - The destination alpha value (1 if no stored alpha)
- **There are 8 blending functions:**
 - Porter-Duff "source" mode (copy source to destination)
 - Porter-Duff "source **over** destination"/ "destination **over** source"
 - Porter-Duff "source **in** destination"/ "destination **in** source"
 - Lighten (choose lighter of source and destination)
 - Darken (choose darker of source and destination)
 - Multiply (black source pixel forces black, white leaves unchanged)
 - "Screen"(white source pixel forces white, black leaves unchanged)
 - Additive (add pixel values, add alpha up to 1)

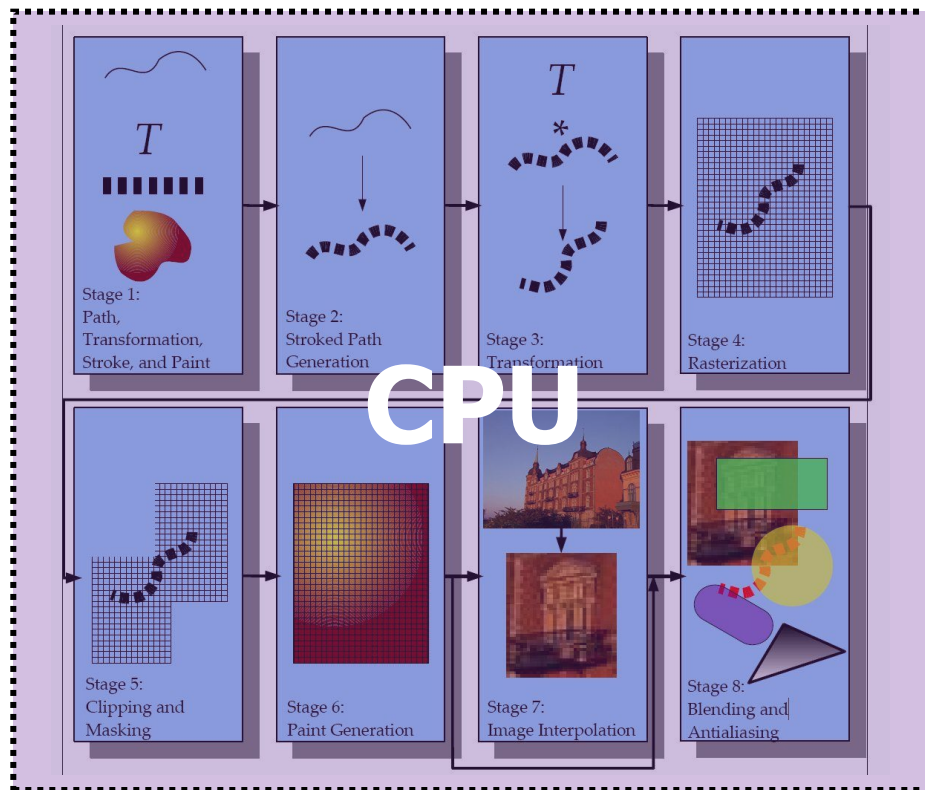

OpenVG with Native Graphics Processor

- CPU sending data and commands to OpenVG hardware
- OpenVG rendering pipeline is in the hardware

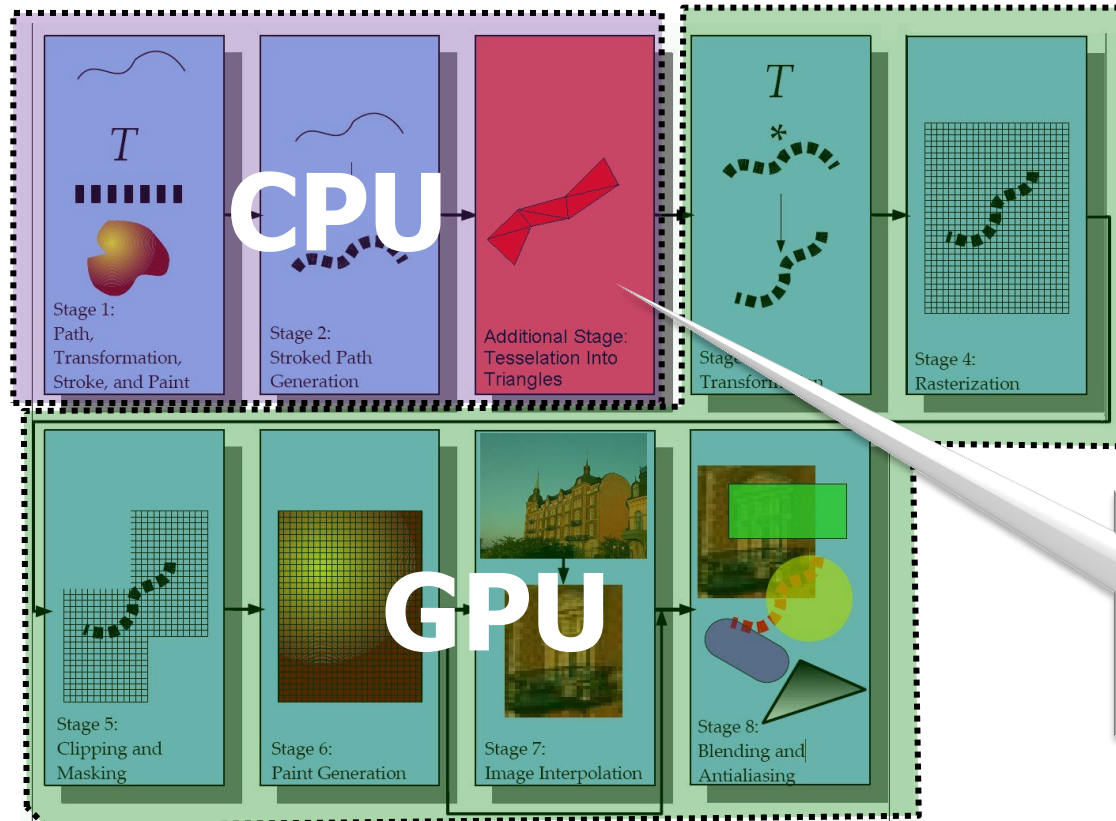

Software Implementation

- Many implementation alternatives
- Everything is processed on the CPU (or +FPU)
 - Power consumption is often the CPU maximum power

OpenVG with a 3D GPU (tessellation)

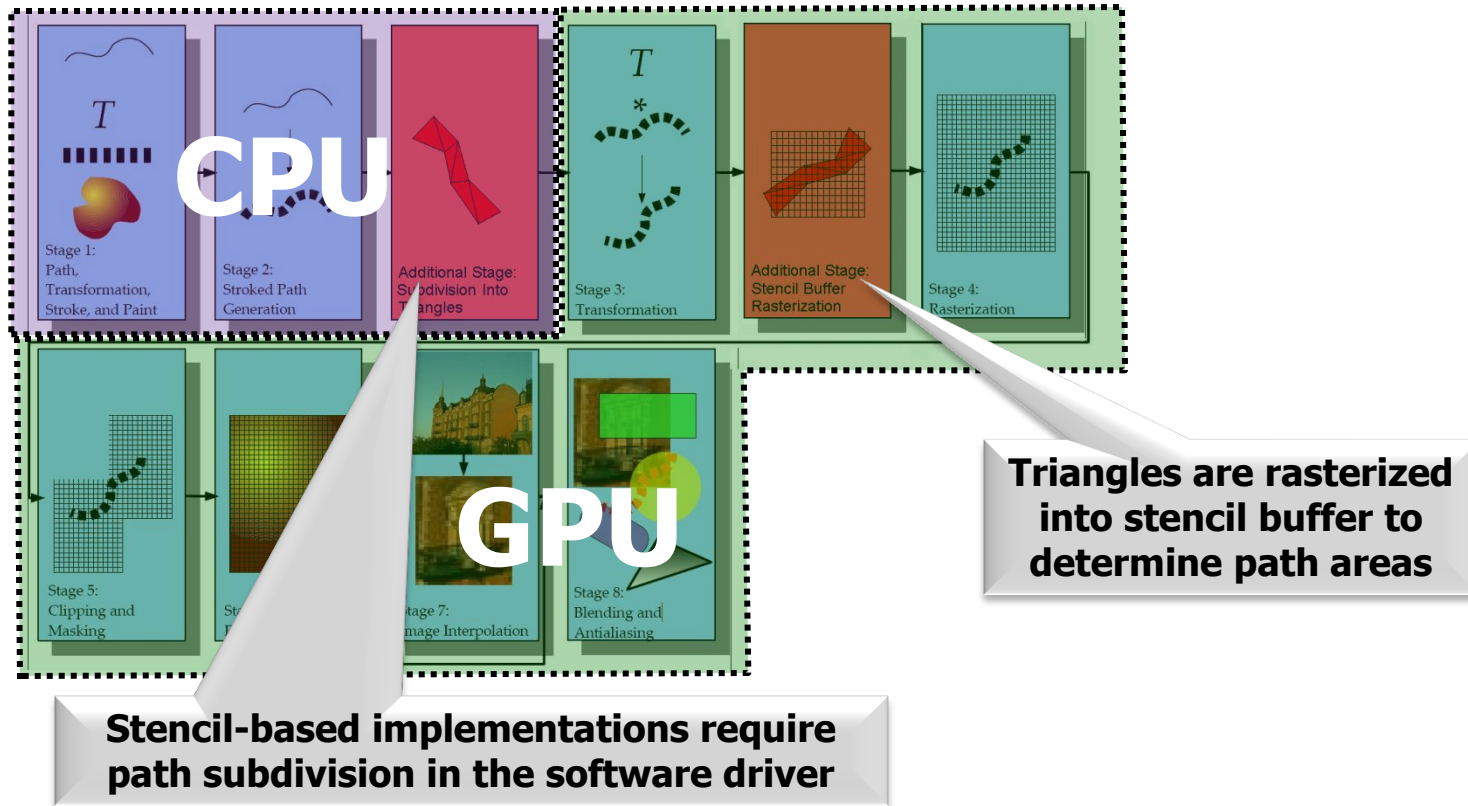

- 3D hardware is not tailored for tessellating arbitrary paths to triangles which causes significant pre-processing to the CPU
- Frame-rates can be discontinuous when tessellation computed infrequently

Tessellation-based implementations require complex polygon tessellation in the software driver

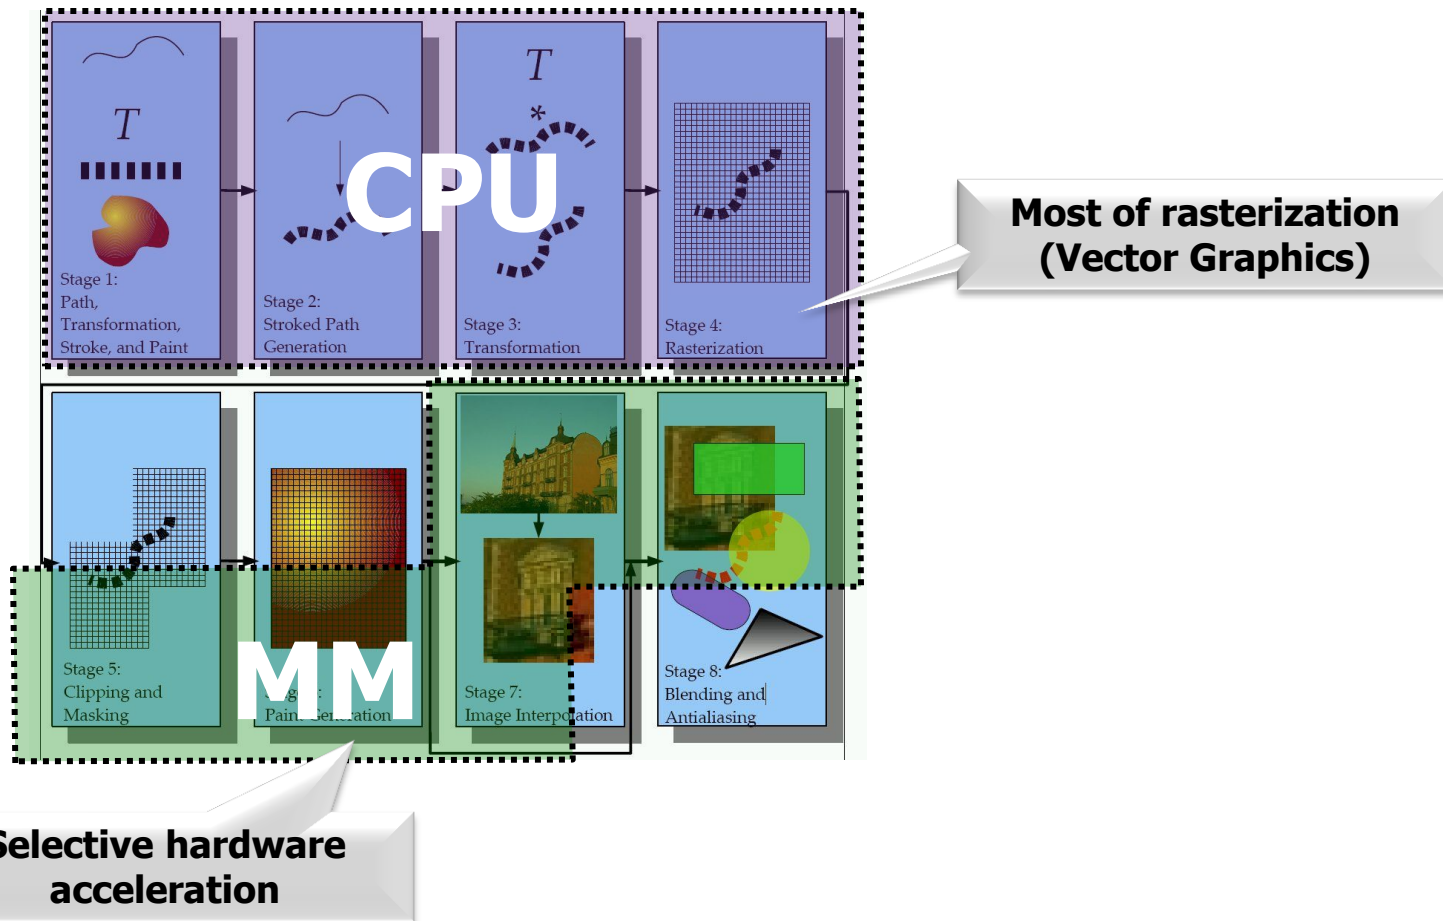

OpenVG with a 3D GPU (stencil)

- Path subdivision is computationally simpler than path tessellation
- Stencil buffer rasterization consumes a lot of memory bandwidth

OpenVG with Multimedia Hardware

- Using double buffer, fast image processing, BitBlit

Implementations

- **Conformant Products**

- Takumi GV series
- DMP dandelion VG
- Vivante GC series
- ARM Mali series
- Inst. for Information Industry DeltaVG
- Imagination PowerVR SGX, MBX with VGP
- Broadcom – VideoCore III
- HUONE – AlexVG engine
- NVIDIA – NVIDIA AP

Implementations

- **Not conformant but based on OpenVG**
 - ShivaVG – Open Source OpenVG on OpenGL
 - Mazatech – AmanithVG (Software and on OpenGL ES)
 - Hooked Wireless – Hooked OpenVG (on OpenGL ES)
 - HUONE – AlexVG forge (on OpenGL ES)

Applications

- **GUI**

- Mobile Devices GUI – Samsung
 - Bitmap Graphics, Flash lite, OpenVG, Flash lite on OpenVG
- Qt Rendering on OpenVG

- **Mapping**

- GPS, map drawing

- **Flash lite player**

- Flash 10.1 → Accelerating on OpenGL ES 2.0

- **SVG Mobile Player**

- MMS, DCD, MPEG4-LASeR, WAP, eBook, WebKit
- Java Bindings - JSR226, JSR271, JSR287

- **Games**

Applications: GUIs

Croix GUI

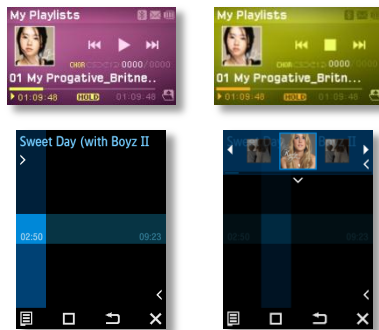

Magic Touch GUI

TouchWiz GUI

Multimedia Player

BEAT DJ

Simplified Main Menu

Nokia 500

- **OpenVG accelerating Smart Phone**
- **UI Acceleration**

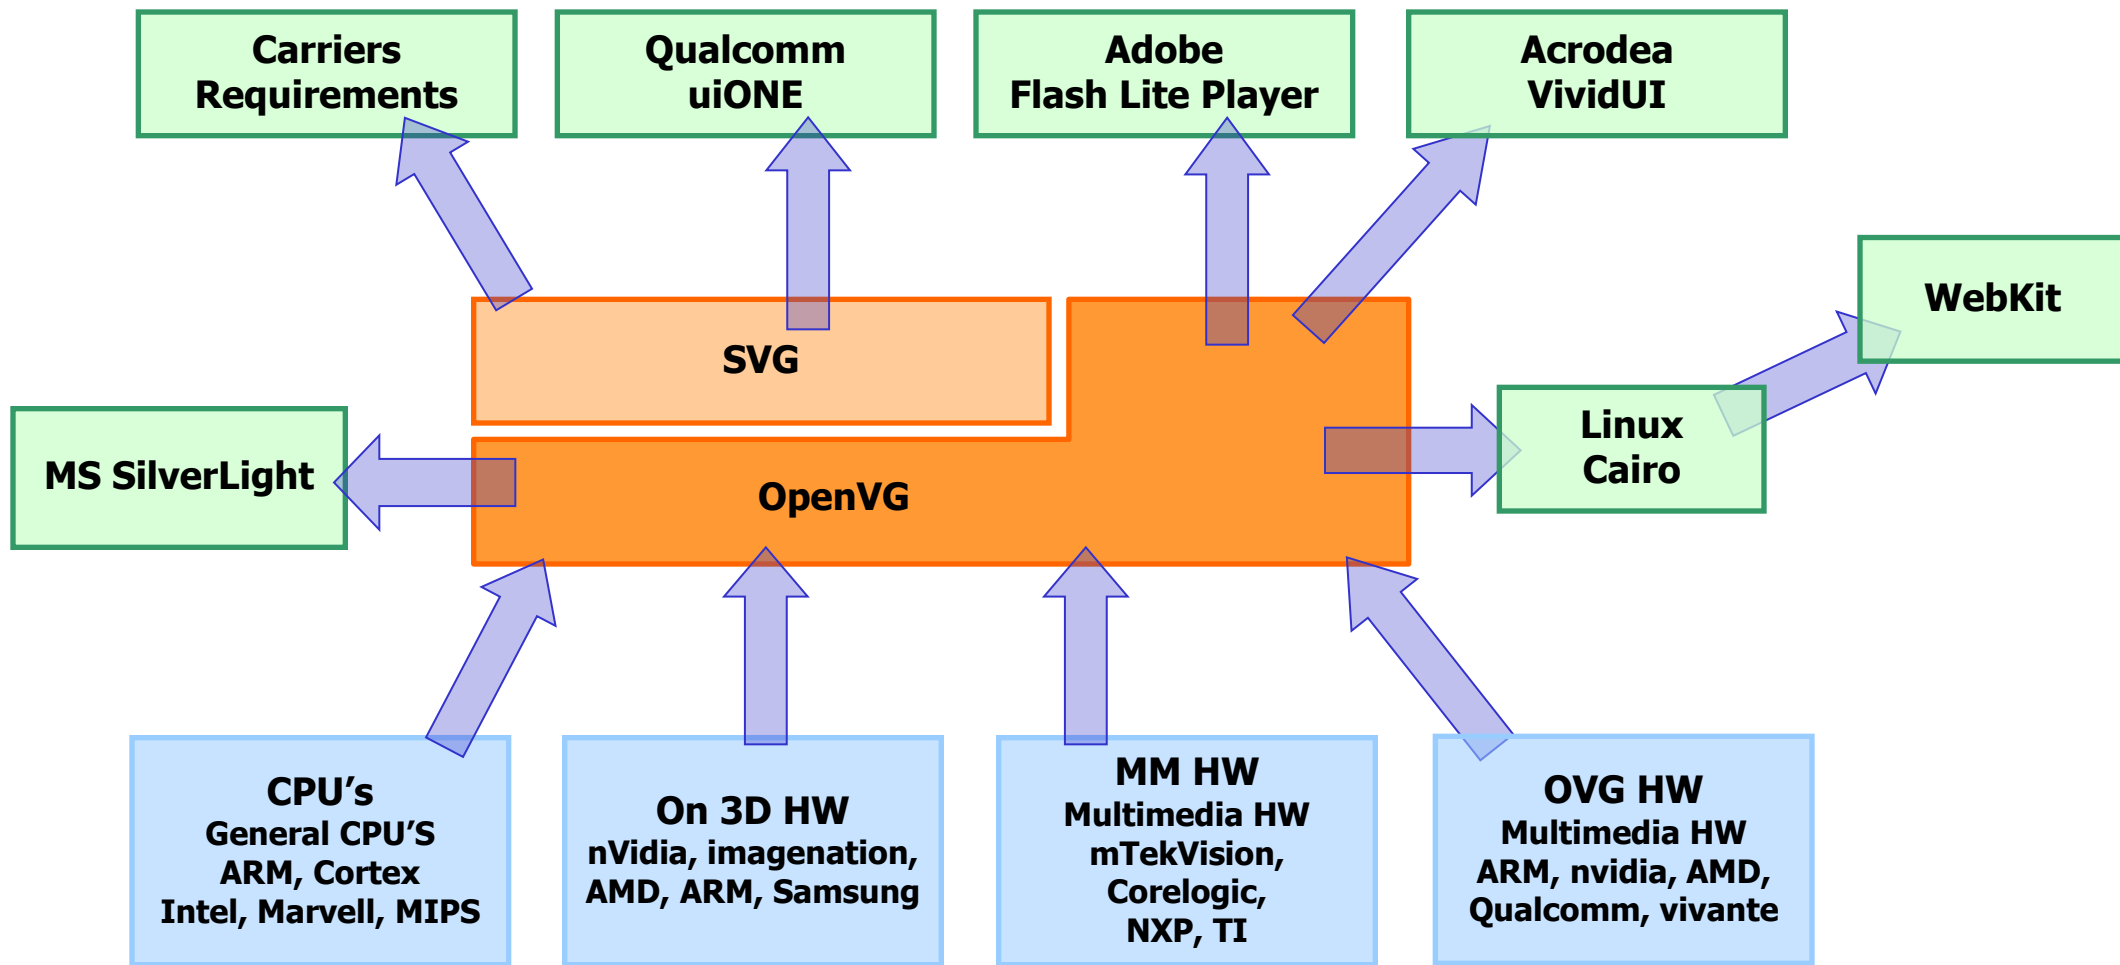

Applications: Web, eBook, Rich Media

Applications: Monitoring, Mapping

Vector Graphics and Other Technologies

OpenVG Roadmap

- **OpenVG Express – Streamlined, refactored**
 - Investigations
 - No Addition of feature
 - No Removal of feature
 - Reduce HW and SW complexity
 - by reducing CTS complexity and pass conditional score and limited and fixed Color Space
 - Major Target Application – SVGTiny 1.1/1.2 , Flash Lite Player
 - CTS - Making it more effective and more accessible to new vendor

Examples of OpenVG Application

- **Demo**
